Instalando e Testando filebeat

```
sudo apt-get update && sudo apt-get install filebeat

sudo /bin/systemctl stop elasticsearch.service
sudo /bin/systemctl start elasticsearch.service

mkdir /home/student/logs
cd /home/student/logs
wget http://media.sundog-soft.com/es/access_log

cd /etc/filebeat/modules.d
sudo mv apache.yml.disabled apache.yml
Edit apache.yml, add paths:
["/home/student/logs/access*"]
["/home/student/logs/error*"]

sudo /bin/systemctl start filebeat.service
```

```
# Module:
# Docs: ht

- module:
  # Access
  access:
    enable

    # Set
    # File
    var.pa

  # Error
  error:
    enable

    # Set
    # File
    #var.p
```

```
var.paths: ["/home/student/logs/access*"]

# Error logs
error:
  enabled: true

  # Set custom paths for the log files. If left empty,
  # Filebeat will choose the paths depending on your OS.
  var.paths: ["/home/student/logs/error*"]
```
